

To: Anyone Wanting To See Research Data Using Oxy Blast For Swine

Unfortunately, we do not have any official research data from universities, or any "peer reviewed data". That does not discourage us to recommend and use Oxy Blast for swine. Real farm performance success with repeated orders from the same customers over and over again does speak for itself. (Essential Water Solutions Inc. has sold over 4000 systems to date.) From my consulting business standpoint, I can share the following results from producers who are still using Oxy Blast.

Sow Herd: Better and more consistent feed intake post-farrowing with less constipation, less abortions and stillborns, less medication use, in some cases no medications at all, and improved conception results.

Nursery: Less mortality and morbidity by a large percentage (5-50%) depending on the disease threshold, improved and more consistent gains and weights coming out of the nursery, less respiratory issues, less medication use and cost and in some cases no medications. When medications didn't work anymore, Oxy Blast at high pulse rates of 800 PPM greatly improved performance.

Growing and Finishing: Improved gains and overall performance with less fall-outs, less medication use and cost (in many cases no medications at all), better feed conversions, smoother transition from feed/phase changes, healthier barn/air environment and less solids in the manure pit over time.

In all cases less ammonia and hydrogen sulfide gas (odor) is observed, making for a more pleasant environment for the pigs and the people working in the barn. Barn clean-up time and water use was greatly reduced in all barns by as much as 25-50% when using Oxy Blast. Oxy Blast is an excellent disinfectant by itself so there is less cost for power washing, no rinsing of the disinfectant or no waiting/drying time for moving pigs back into the barn.

In all phases of production we achieve better, cleaner water quality when using Oxy Blast at the correct rate (PPM). Water testing is utmost important to determine the correct and most economical rate of use of Oxy Blast. All lines, nipples and water equipment stay cleaner and last longer reducing maintenance and down time, therefore, a great reduction of disease transfer from pig to pig.

We will offer the Oxy Blast product at no cost to prove many of the benefits listed above will happen on your hog operation. Before starting a trial, we would insist on a water analysis so we know what we are dealing with as far as water quality. We have three other "companion products" if the water is high in sodium, TDS or pH we may recommend. We look forward to working with you and your operation.
